CONTI SYNCHRODRIVE® Synchronous drive belts

Properties / Construction / Designation / Product range / Tolerances

CONTI SYNCHRODRIVE® Synchronous drive belts

CONTI SYNCHRODRIVE[®] Belts for synchronous transmission of rotary and linear motion

CONTI SYNCHRODRIVE® belts are power transmission products made from a highly durable polyurethane elastomer incorporating a steel-cord tension member. They are manufactured precisely to length using a newly developed production technique.

CONTI SYNCHRODRIVE® belts can be used in the openended or endless form. In all cases, they ensure that rotary motion is transmitted uniformly and with angular precision. CONTI SYNCHRODRIVE® belts permit low-cost drive designs, even where difficult operating conditions have to be taken into account. Their properties provide a highly reliable, maintenance-free solution to even the most demanding drive problems. CONTI SYNCHRODRIVE® belts are available in 10 tooth profiles and several standard widths, covering a host of different applications involving various loads and service conditions. They are ideal for drives with a large center distance, for synchronous conveyor systems and transport devices with sliding rails as well as for positioning and reversing drives in linear and control engineering. Modern production techniques and rigorous in-process quality controls guarantee products with maximum reliability and a consistently high standard of quality.

Properties

Precise synchronism due to positive engagement

The belt teeth mesh with those of the pulley in the same manner as the teeth on a gear. This positive drive principle provides synchronous operation and eliminates speed variation.

A variety of possible applications at low design cost

CONTI SYNCHRODRIVE[®] belts can be used as synchronous drive or transport belts in either the openended or endless version. For special applications, CONTI SYNCHRODRIVE[®] belts can have heavy-duty profiles welded to them for indexing and conveying applications. As open-ended drive components, CONTI SYNCHRODRIVE[®] belts are ideal for linear and control drives that have to transmit rotary motion with repeat accuracy and multiple positioning control.

Low loads on shafts and bearings

The tooth grip principle requires only low initial belt tensioning. Thus the load on shafts and bearings is kept to a minimum.

Compact drive design

High dynamic stability and flexibility allows the use of small pulley diameters, low center distances, and belt-back idlers. This enables a lightweight, low-cost drive setup with less space requirement.

No maintenance

CONTI SYNCHRODRIVE® belts are maintenance-free; no lubrication or retensioning is required. Constant belt tension is guaranteed by the use of a high-strength steelcord tension member.

High efficiency

The superb flexural properties of the synchronous drive belt as well as the exact dimensional mating of the belt and pulley tooth contours permit drives with an efficiency of 98%.

CONTI SYNCHRODRIVE® belts are resistant to

- wear
- oil and grease
- petrol and benzene
- hydrolysis
- UV and ozone
- temperatures ranging from 30 °C to 80 °C (for operational temperatures outside –10 °C to 50 °C please seek advice from your Mulco sales partner)
- can be bonded to thermoplastics

Belt versions _

CONTI SYNCHRODRIVE® belts are supplied in the following versions:

- HF high flexibility version all profiles except for 3 mm pitch e.g. for drives with small pulley diameters.
- HP high power reinforced version HTD and STD profiles, e.g. for heavy-duty control systems.
- HS high stiffness of tension member HTD and STD profiles, e.g. for high-precision linear drives.

Other special versions, e. g. aramid tension member, can be supplied on request.

XHP • extremely high power tensile-strength HTD 14M profile, e.g. for lifting systems.

- PAZ with polyamide fabric facing on the teeth side
 e.g. for sliding-rail transport systems.
 Antistatic aPAZ version on request.
- PAR with polyamide fabric facing on the back of the belt e.g. for skid-queuing conveyors.
 Antistatic aPAR version on request.
 - endless belt in HF version and lengths from 1000 mm, all profiles except for 3 mm pitch e.g. for rotary drives with large center distances.

Construction .

Our synchronous drive belts are made up of:

- polyurethane teeth and back, color: black
- steel-cord tension member, with balanced right/left-handed cord twist

Polyurethane teeth and back

Belt teeth and back are made from a tough polyurethane elastomer with excellent adhesion to the tension member. The high wear resistance of the polyurethane ensures trouble-free drive performance and a long service life. These features are enhanced even more by the balanced layout of the tension cords.

Steel-cord tension member

v

Synchronous drive belts for positive drive systems must have a high resistance to elongation and a high tensile strength. Extra-strong steel tension cords, laid parallel to the belt edges, guarantee the belt's high loading capacity and accurate running properties.

CONTI SYNCHRODRIVE® Synchronous drive belts

Designation

CONTI SYNCHRODRIVE[®] synchronous drive belts are specified in accordance with defined standards for the different belt types showing the pitch length, tooth pitch and belt width, plus a code for the belt version, see page 5.

Pitch length in m

The pitch length of the belt is the overall circumference, or length measured at the neutral pitch line. The pitch length is located in the middle of the tension member.

Tooth pitch in mm

The tooth pitch is the linear distance between two adjacent teeth at the pitch line.

Belt width in mm
 The belt width and width designation are identical.

Examples:

The number of teeth is a function of pitch length and pitch:

Product range

Profiles

CONTI SYNCHRODRIVE[®] synchronous drive belts are manufactured in 10 profile sizes. Dimensions of HTD and STD synchronous drive belts correspond to the specifications laid down in ISO/F DIS 13050 (draft version). Table 1 on page 7 gives a summary of the profile dimensions as well as other technical information for the belts we supply. Special pulleys must be used for linear drives with high precision requirements. More information about pulleys is given in section 2 on "Pulleys" which starts on page 10.

Lengths

CONTI SYNCHRODRIVE[®] synchronous drive belts are available in either the open-ended or endless version.

Widths

CONTI SYNCHRODRIVE[®] synchronous drive belts are supplied in several standard widths. Dimensions are given in Table 2 on page 7. Other widths are available on request.

Versions

CONTI SYNCHRODRIVE[®] synchronous drive belts made from polyurethane with steel cords aligned parallel to the belt edges are precision-made components for applications in drive and transportation engineering. Several versions are available to meet various operating requirements. More details are given on page 4 under "Properties".

CONTI SYNCHRODRIVE® Synchronous drive belts

Tolerances

CONTI SYNCHRODRIVE® synchronous drive belts are precision-made products. Manufacturing involves reliable process techniques and maximum accuracy throughout all stages. Deviations in length, width and thickness are subject to extremely tight tolerances.

Pulleys

Designation / Minimum number of teeth / Diameters / Tolerances / Clamping length

Pulleys

Pulleys

Precise belt/pulley conformance is vital to ensure accurate power transmission as well as smooth operation and a long service life for synchronous belt drives.

ContiTech engineers have modified pulley tooth-gap profiles so that they conform ideally to the respective belt profiles.

Use of these optimized pulleys is recommended especially for CONTI SYNCHRODRIVE® HTD belts.

Pulleys with optimized profiles are obtainable from your Mulco sales partner.

Linear drives with demanding positioning requirements need pulleys with minimized gap clearance. If you are planning a special drive design, please consult our application engineers for advice.

Designation

Pulleys for CONTI SYNCHRODRIVE® belt drives are identified in accordance with the standards defined for the various belt types by their number of teeth, tooth pitch and pulley width, as well as a code denoting the type of pulley.

O P

General designation for toothed pulleys.

Number of teeth

The pulley's number of teeth is calculated from the pitch circumference and the pitch:

$$z = \frac{U_w}{t} = \frac{\pi \cdot d_w}{t}$$

Tooth pitch in mm

The tooth pitch of the pulley is the distance between two reference points on adjacent teeth at the circumference of the pitch diameter. The pitch diameter is larger than the outside diameter of the pulley by double the thickness at which the pitch line of belt rides above the pulley. Pulley width in mm

The width designation defines the exact width of the corresponding synchronous drive belt, and not that of the pulley.

Flanged pulley data

F stands for pulleys that are flanged on both sides. Flanged pulleys prevent the belt from riding off. At least one pulley with two flanges must be used and generally, for economy, the smaller pulley of a drive is the flanged pulley. It is also possible to provide each pulley with one flange on alternate sides.

Examples:									
HTD Pulley – P 36 – 8M – 40									
Р	Designation for toothed pulley								
36	36 teeth								
8M	8 mm tooth pitch, HTD profile								
40	Pulley designation for a 40 mm wide								
	synchronous drive belt								
STD	Pulley – P 48 – S 5M – 30								

0101	
Ρ	Designation for toothed pulley
48	48 teeth
S 5M	5mm tooth pitch, STD profile
30	Pulley designation for a 30 mm wide
	synchronous drive belt

Minimum number of teeth

Drives fitted with CONTI SYNCHRODRIVE® synchronous drive belts should have pulleys that meet the specified minimum number of teeth. Table 6 shows the minimum number of teeth z_{min} and the minimum pitch diameter $d_{w\ min}$ for pulleys as well as the minimum diameter d_{min} for inside and outside idlers that are to be considered when designing a drive. Inside idlers should be toothed pulleys.

> 200	0,13 + 0,0005 per mm outside diameter					

Parallelism

Parallelism between the bore and teeth may not exceed the maximum deviation of 1 μm per millimetre of pulley width.

Draft

The maximum allowable draft is 1 μm per millimetre of face width, but it must not exceed the permissible diameter tolerance.

Pulleys

Clamp plates

CONTI SYNCHRODRIVE® synchronous drive belts that are used as openended power transmission components must be clamped with a positive fit at their ends. Clamp plates must have the corresponding tooth profile. The clamping screws should be positioned on both sides of the belt, and tightened in a uniform fashion. Fig. 2 shows the type of clamp plate used. Dimensions for the standard type are given in Table 17. Clamp plates for CONTI SYNCHRODRIVE® belt drives are

available from your Mulco sales partner.

Glossery of symbols and terms, Drive calculation data, Examples of design procedure steps: Lifting drive, Linear drive

Calculation of synchronous belt drives

Calculations are based on drives fitted with CONTI SYNCHRODRIVE® synchronous drive belts. Drive design data are given in the following diagrams and tables. As so many factors influence belt performance, it is suggested that designers of complicated drives consult your Mulco sales Partner.

Synchronous belt linear drive with 2 pulleys and no deflection

Synchronous belt linear drive with 1 pulley and deflection idlers

Drive calculation data

The following pages contain all the data, formulae and tables needed when designing a new drive fitted with a CONTI SYNCHRODRIVE® synchronous drive belt. Tables for values which can easily be calculated using the formulae provided have been omitted.

The torques and effective pulls to be transmitted do not require any safety factors providing the maximum values are observed and the load is uniform. Corresponding factors must be applied in the event of fluctuating and alternating loads as well as with accelerating or braking processes.

Overall service factor c0

The overall service factor c_0 takes into consideration the loads occurring under special operating conditions, and is the sum of load factor c_2 and acceleration factor c_3 .

 $c_0 = c_2 + c_3$

Teeth in mesh factor c1

The teeth in mesh factor c_1 considers the number of teeth ze of the small pulley z_k meshing with the teeth of the synchronous drive belt.

$$z_e = z_k \cdot \frac{\beta}{360}$$

Calculation of the arc of contact β is explained on page 21. The value for teeth in mesh factor c1 corresponds to the number of teeth in mesh z_e .

The following maximum values apply:

c_{1 max} = 12 for CONTI SYNCHRODRIVE® synchronous drive belts, type M

c_{2 max} = 6 for CONTI SYNCHRODRIVE® synchronous drive belts, type V

The minimum numbers of teeth z_{min} for pulleys that are to be taken into consideration when designing a drive are contained in Table 6 on page 11.

Load facor c2

Load factor c_2 is used to compensate for operating conditions. The factors given below are indicative values only.

Table 18 Load factor c ₂							
Operation conditions	Load factor c2						
Steady load	1,0						
Fluctuating load low	1,4						
Fluctuating load average	1,7						
Fluctuating load high	2,0						

Acceleration factor c₃

The acceleration factor c_3 is applied if the step-up transmission ratio is > 1.24.

Table 19 Acceleration factor c ₃					
Transmission ration $\frac{1}{i}$	Accelertion factor c ₃				
1,00 - 1,24					
1,25 - 1,74	0,1				
1,75 - 2,49	0,2				
2,50 - 3,49	0,3				
≥ 3,50	0,4				

Transmission ratio i

Transmission ratio i is obtained from the ratio of pulley speeds n_1 and n_2 or the number of teeth z_2 and z_1 or the pitch diameters of pulleys d_{w2} and d_{w1} .

$$i = \frac{n_1}{n_2} = \frac{z_2}{z_1} = \frac{d_{w2}}{d_{w1}}$$

Number of teeth z and pitch diameter d_w of the pulleys

The number of teeth z and the pitch diameter $d_{\rm W}$ of the pulleys are determined by means of pitch t of the chosen tooth profile.

$$z = \frac{\pi \cdot d_W}{t}$$
 $d_W = \frac{z \cdot t}{\pi}$ mm

Numbers of teeth, pitch and outside diameters of pulleys are contained in Tables 7 to 13 on pages 12 to 15.

Arc of contact β

For two-pulley drives, the arc of contact β around the small pulley is calculated as follows:

$\beta = 2 \cdot \arccos$	$\left[\begin{array}{c} t \cdot (z_g - z_k) \\ \hline 2 \cdot \pi \cdot a \end{array} \right]$	°(Grad)
---------------------------	---	---------

For multiple-pulley drives, the arc of contact β has to be calculated in accordance with the given geometry.

Belt speed v

Belt speed v is derived from speed n in r.p.m., number of teeth z and pitch t in mm or pitch diameter d_w .

 $v = \frac{n \cdot z \cdot t}{60 \cdot 10^3} = \frac{n \cdot d_W \cdot \pi}{60 \cdot 10^3}$ m/s

Center distance a

Center distance is calculated as follows for circular path drives with two pulleys and where transmission ratio i = 1:

$$a = \frac{L_w - z \cdot t}{2}$$
 mm

Where i does not equal 1, center distance a is approximated as below:

$$a \approx \frac{1}{4} \cdot \left[L_w - \frac{t}{2} \cdot (z_g + z_k) + \sqrt{\left[L_w - \frac{t}{2} \cdot (z_g + z_k) \right]^2 - 2 \cdot \left[\frac{t}{\pi} \cdot (z_g - z_k) \right]^2} \right] \text{ mm}$$

Pitch length L_W

For a two-pulley drive, pitch length ${\rm L}_{\rm W}$ of the synchronous drive belt is approximated as below:

$$L_{w} \approx 2 \cdot a + \frac{t}{2} \cdot (z_{g} + z_{k}) + \frac{\left[\frac{t}{\pi} \cdot (z_{g} - z_{k})\right]^{2}}{4 \cdot a} \quad \text{mm}$$

and calculated precisely as follows:

$$L_{w} = 2 \cdot a \cdot \sin \frac{\beta}{2} + \frac{t}{2} \cdot \left[z_{g} + z_{k} + \left(1 - \frac{\beta}{180} \right) \cdot (z_{g} - z_{k}) \right] \text{ mm}$$

For linear and multiple-pulley drives, pitch length $L_{\rm W}$ is determined in accordance with the given geometry.

Effective pull F_u, torque M, power P

The following equations are used to calculate effective pull F_u , torque M and power P:

$$F_{u} = \frac{P \cdot 10^{3}}{v} = \frac{M \cdot 2 \cdot 10^{3}}{d_{w}} N$$
$$= \frac{P \cdot 9,55 \cdot 10^{3}}{n} = \frac{F_{u} \cdot d_{w}}{2 \cdot 10^{3}} Nm$$
$$P = \frac{M \cdot n}{9,55 \cdot 10^{3}} = \frac{F_{u} \cdot v}{10^{3}} kW$$

Drive calculation data

Belt width b

Belt width b is calculated from the effective pull F_u to be transmitted, the specific load on tooth flank $F_{u\ spez}$ as well as the service factor c_0 and the teeth in mesh factor c_1 .

$$b_{err} = \frac{F_u \cdot c_0 \cdot 10}{F_u \operatorname{spez} \cdot c_1} \quad \text{mm}$$

Values for the specific load on tooth flank $F_{u\;spez}$ can be taken from Figs. 6 to 7 on pages 24 and 26.

Once the belt standard width b has been determined, it is necessary to check the tension member load.

Permissible tension member loads F_{zul} for synchronous drive belts with standard widths are contained in Tables 20 and 22 on pages 25 and 27. The following rule applies:

$$F_{zul} \ge F_{T \max} \cdot c_0 N$$

The next section explains how to determine the dynamic belt tension ${\rm F}_{\rm T\ max}.$

Belt installation tension F_V

Tensioning of the belt is a decisive factor affecting the reliability, performance and life of a synchronous belt drive.

Calculation

For linear drives, installation tension is calculated as the belt tension. The following rule applies to the static belt tension F_T :

```
F_T \ge F_{u \max} N
```

Maximum belt tension $F_{T\mbox{ max}}$ occurring in the dynamic state is derived from

$$F_{T max} = F_T + F_{u max}$$
 N

With circular path drives, installation tension is usually given as shaft load F_{v} . The following equation applies:

$$F_v = F_u \cdot \sin \frac{\beta}{2} N$$

Adjusting installation tension F_T via the takeup allowance

On linear drives, installation tension is adjusted via belt elongation. The takeup allowance a in mm is derived from the belt tension F_T , the belt dimensions L_w and b as well as the spring constants c_{spez} .

For linear drives as shown in Fig. 3 on page 18

$$\Delta a = 2 \frac{F_T \cdot L_W}{c_{spez}} b mn$$

For linear drives as shown in Fig. 4 on page 18

$$\Delta a = -\frac{F_T \cdot L_w}{c_{spez} \cdot b} \qquad \text{mm}$$

The values for the spring constants c_{spez} can be taken from Tables 21 and 23 on pages 25 and 27.

Adjusting installation tension via the frequency measurement method

Installation tension on linear drives can also be adjusted by measuring the natural frequency of a vibrating belt span. It must be remembered, however, that measurable vibrations are only obtainable from a free span length L_f up to a certain length.

See also our calculation examples.

$$f = \sqrt{\frac{F_T}{4 \cdot m \cdot L_{f^2}}}$$

Selecting the tooth profile

A suitable tooth profile is selected from Fig. 5 by locating the point at which the effective pull to be transmitted intersects with the possible belt width. The belt with the greatest power transmitting capacity should be selected. In borderline cases, it is recommended that the smaller profile is taken as a basis for drive design calculation.

Specific load on tooth flank F_{u spez}, tension member load F_{zul}, specific spring constant c_{spez}

The values required for the specific load on tooth flank, tension member load and specific spring constant in order to arrive at a precise drive design can be taken from the diagrams and tables on the following pages.

The specific load on tooth flank F_{u spez} can be taken from

Figs. 6 and 7 after calculating speed n in r.p.m. from the

given belt speed v in m/s and the pulley diameter ${\rm d}_{\rm W}$ in mm for the corresponding profile.

Tension member load F_{zul} in N is given in Tables 20 and 22. Tables 21 and 23 show the specific spring constant c_{spez} in N/mm for calculating takeup allowance Δa .

Examples of design procedure steps: Lifting drive

Example

Determine the CONTI SYNCHRODRIVE® synchronous drive belt needed for a lifting drive with the following specification:

Pitch length of the belt	L_{W}	=	6000 mm
Pitch diameter of the pulleys	d_{w}	=	80 mm
Mass of the carriage	ms	=	45 kg
Friction force	F_R	=	50 N
Travel at v _{const}	S _C	=	2,0 m
Travel speed	V	=	2 m/s
Acceleration	a _b	=	8,0 m/s ²
Braking deceleration	av	=	8,0 m/s ²

 $s_{b} = \frac{2^{2}}{2 \cdot 8}$

 $\frac{2^2}{2\cdot 8}$

Calculate linear monementum

Acceleration distance

$$s_{b} = \frac{v^{2}}{2 \cdot a_{b}}$$

Braking distance

$$s_v = \frac{v^2}{2 \cdot a_v}$$

Total travel

 $s_{ges} = s_b + s_c + s_v$

Select tooth profile

 $F_u = m_s \cdot a_b + m_s \cdot g$

Select profile

Selected:

s_{ges} = 0,25 + 2,0 + 0,25 = 2,5 m

= 0,25 m

= 0,25 m

Pulleys

Selected: $d_w = 81.49 \text{ mm}$ Pitch diameter d_w z = 32 from Table 9 on page 13 Design-specific $d_F = 40 \text{ mm}$ finished bore Mass of the pul $m_{Sch} = 1,53 \text{ kg}$ leys according to manufacturer's specification HTD Pulley Pulley designation P 32 - 8M - 30

$F_u = 45 \cdot 8 + 45 \cdot 9,81 = 801,5 N$

CONTI SYNCHRODRIVE® synchronous drive belt profile 8M width 30 mm type M HP

Precisely determine the maximum effective pull to be transmitted

Mass of carriage m_s

Mass of belt m_R $m_R = m_{spez} \cdot b \cdot L_w$ Weight from Table 1 on page 7

Reduced mass of the pulleys

 $m_{\text{Sch red}} = \frac{m_{\text{Sch}}}{2} \cdot \left(1 + \frac{d_{\text{F}}^2}{d_{\text{a}}^2}\right)$

Total mass $m_{ges} = m_s + m_R + M_{Sch red}$

Maximum effective pull to be transmitted

 $F_{u max} = m_{ges} \cdot a_b + m_s \cdot g + F_R$

Calculation factors

Tooth in mesh factor c_1 from page 20

Load factor for average fluctuation load c_2 from Table 18 on page 20

Acceleration factor c_3 from Table 19 on page 20

Overall service factor $C_0 = C_2 + C_3$

Determine belt width in accordance with allowable flank load

 $b_{err} = \frac{F_{u \text{ max}} \cdot c_0 \cdot 10}{F_{u \text{ spez}} \cdot c_1}$

 $F_{u \text{ spez}}$ from Table 6 on page 24

Requirement $b > b_{err}$ Next grater belt width b from Table 2 on page 7 m_s = 45 kg

 $m_R = 6,32 \cdot 10^{-3} \cdot 30 \cdot 6 = 1,14 \text{ kg}$

$$m_{\text{Sch red}} = \frac{1.53}{2} \cdot \left(1 + \frac{40^2}{80, 12^2}\right) = 0.96 \text{ kg}$$

m_{ges} = 45 + 1,14 + 0,96 = 47,1 kg

 $F_{u max} = 47, 1 \cdot 8 + 45 \cdot 9, 81 + 50 = 868 N$

$$b_{err} = \frac{868 \cdot 1.7 \cdot 10}{43 \cdot 12} = 29 \text{ mm}$$

Selected: b = 30 mm

Belt installation tension The following applies for linear drives: $F_T \geqq F_{u\mbox{ max}}$	Selected: $F_T = 900 \text{ N} > 868 \text{ N}$
Max. belt tension dynamic	
$F_{T max} = F_{T} + F_{u max}$	F _{T max} = 900 + 868 = 1768 N
Takeup allowance for linear drives $\Delta a = \frac{F_T \cdot L_w \cdot 10^3}{2 \cdot c_{spez} \cdot b}$	$\Delta a = \frac{900 \cdot 6000}{2 \cdot 35 \cdot 30} = 2,6 \text{ mm}$
c _{spez} from Table 21 on page 25	
Alternatively it is possible to install the pretension via frequency mea end nearby (about 1 m) to the deflection point. This freely chosen s also page S. 22.	

Free span length

Selected: $L_f = 1 m$

Weight m per m length $m = m_{spez} \cdot b$

m_{spez} from Table1, Page 7

m = 6,32 · 10⁻³ · 30 = 0,19 $\frac{\text{kg}}{\text{m}}$

Belt tension frequency $f = \sqrt{\frac{F_T}{4 \cdot m \cdot L^2}}$	$f = \sqrt{\frac{900}{4 \cdot 0.19 \cdot 1^2}} = 34 \text{ Hz}$
V 4 · m · L _f ²	The belt has the right pretension when the measured frequency is the same as the calculated frequency.

	Requirement is fulfilled, i.e. the allowable tension member load is greater than the maximum belt tension taking the service factor into consideration.
Design choice:	CONTI SYNCHRODRIVE® HTD synchronous drive belt M 6 – 8M – 30 HP

Fig. 9

Examples of design procedure steps: Linear drive

Example

Determine the CONTI SYNCHRODRIVE® synchronous drive belt needed for a linear drive with the following specification:

			0000
Pitch length of the belt	LW	=	8000 mm
Pitch diameter of the pulley	d_{w}	=	80 mm
Idler diameter	d	<	60 mm
Mass of carrige	ms	=	30 kg
Coefficient of friction	μ	=	0,6
Travel time	t _c	=	3 s
Travel at v _{const}	S _C	=	5,0 m
Acceleration distance	sb	=	0,5 m
Braking distance	SV	=	1,5 m

Linear drive - principle and motion diagram

Calculate acceleration and braking deceleration

Travel speed

$$v = \frac{s_c}{t_c}$$

Acceleration

$$a_b = \frac{v^2}{2 \cdot s_b}$$

Braking deceleration

$$a_v = \frac{v^2}{2 \cdot s_v}$$

$$a_{b} = \frac{1,67^{2}}{2 \cdot 0,5} = 2,79 \text{ m/s}^{2}$$

 $v = \frac{5}{3} = 1,67 \text{ m/s}$

 $a_V = \frac{1.67^2}{2 \cdot 1.5} = 0.93 \text{ m/s}^2$

Select tooth profile

Approximate calculation of effective pull to be transmitted $F_u = m_s \cdot a_b + m_s \cdot g \cdot \mu$

Select profile from Fig. 5, page 23

$F_u = 30 \cdot 2,79 + 30 \cdot 9,81 \cdot 0,6 = 260 \text{ N}$

Selected: CONTI SYNCHRODRIVE® synchronous drive belt, profile 5M width 30 mm type M HP

Mulco belt-pilot

Your direct road to perfect design solutions

Mulco belt-pilot - online support at www.mulco.net

Let others talk about being close to the customer, we as the market leading provider of polyurethane timing belts actually live by the idea. Mulco-Europe EWIV's secret of success has always been largely due to advising our customers before they enter the design stage. Mulco belt-pilot is taking our customer dedication a critical step further ahead. Our interactive Internet service offering enables you to calculate your personal design solutions online. Whatever field of technology you are interested in - power transmission, linear, transport or components - start Mulco belt-pilot at www.mulco.net for 24/7 access to the actual product information, CAD downloads and calculations you need.

Mulco b@lt-pilot

Many benefits.

- Interactive service offering with video-based e-learning option
- Extensive product databases
- Free use of CAD downloads
- Import the CAD drawings into your CAD system
- Calculate timing belts, pulleys and components
- Email inquiries supported

Belt tension gauges

Setting the correct pre-tension force

Clavis and SM4 belt tension gauges - simple, practical and efficient

Clavis and SM4 belt tension gauges allow you to measure the resonant frequency of a vibrating belt span. This resonant frequency directly depends on the belt tension. When starting to use or servicing a drive, these gauges are indispensable when it comes to properly adjusting the pre-tension force. A correct pre-tension force minimizes the load on the bearings, optimizes the running of the belt and, thus, extends the life of the drive. Moreover, it reduces the noise level and balances non-parallelism of wide polyurethane timing belts.

Clavis uses microphones to acoustically measure the frequency of the vibrating belt.

- Measuring ranges: 30 Hz ... 600 Hz (standard) and 10 Hz ... 300 Hz
- Precision: +/- 1 %
- For all polyurethane drive belt models with different tension members (e. g. steel, aramid, glass-fibre)
- Broad portfolio of replaceable sensor heads
- Integrated calibration equipment
- Battery-powered
- Steel tuning fork for fast frequency sampling included
- Ships with a calibration certificate and a case

Span tension gauge SM4 uses a sensor to measure the frequency of the vibrating belt.

- Measuring range: 7 Hz ... 350 Hz
- Precision: +/- 5 %
- For all polyurethane drive belt models with different tension members (e. g. steel, aramid, glass-fibre)
- Large display
- Weighs just 110 g
- Belt clip
- Battery-powered
- Ships with a transport case and protective sleeve

Polyurethane timing belt welder

Welds what belongs together

The portable TSG 4 welder - ready for a quick change

Even top-quality products will eventually wear out. The same applies to polyurethane timing belts which, from time to time, need to be replaced. We designed the portable TSG welder to assist you in replacing drive units that take a lot of mounting effort and are difficult to access due to upstream machine components. The portable TSG welder is easy to operate and allows you to weld polyurethane timing belts onsite, immediately in or at the machine. The TSG 4 welding unit is available in two versions: for belt widths up to 50 mm and for belt widths up to 100 mm.

One welder, many benefits

- Suitable for all timing belt profiles
- Short machine downtimes
- Easy to operate
- Flexible through long power cords
- Welds and cools down in as little as about 30 minutes
- Air-cooled, no water supply required
- Powerful heater output

Standard package

- Welder with belt-specific, replaceable weld face
- Control unit for automatic welding and cooling down
- Control unit and welder connect by metal-reinforced cable
- Transport case with tools

Technical data TSG 4 - 50

Operating voltage: 230 V/50 Hz
Power consumption: 1.2 kW
Welder dimensions: W 240 mm x H 190 mm x D 180 mm
Welder weight: approx. 7.0 kg
Control unit dimensions: Type-III/TSG MR 10 W 330 mm x H 170 mm x D 330 mm
Control unit weight: approx. 9.5 kg
Carrying case weight: approx. ca. 4.5 kg

Technical data TSG 4 - 100

Operating voltage: 230 V/50 Hz
Power consumption: 2 kW
Welder dimensions:
Welder weight: approx 8.0 kg
Welder weight: approx. 8.0 kg Control unit dimensions:
Type-III/TSG MR 10
B 330 mm x H 170 mm x D 330 mm
Control unit weight: approx. 9.5 kg
Carrying case weight: approx. ca. 4.5 kg

Special accessories

- Hydraulic punch
- Weld jigs for all standard belt profiles
- Punch box
- All units available separately
